1 About Cyfrin

Cyfrin is a Web3 security company dedicated to bringing industry-leading protection and education to our partners and their projects. Our goal is to create a safe, reliable, and transparent environment for everyone in Web3 and DeFi. Learn more about us at cyfrin.io.

2 About This Document

This document is a public summary of the security audit Cyfrin performed for Securitize on Securitize Bridge CCTPv2. It records the repositories and commits reviewed, the timeline, auditors, in-scope files, and the number and final status of findings by severity. It closes with Cyfrin's attestation of the review's scope and final remediation status.

It is deliberately abbreviated: the technical detail of individual findings is not reproduced here. The complete audit report, version 2.0 dated October 7, 2025, was delivered to Securitize, who retain it as the full record of the engagement. This summary was issued on October 29, 2026.

3 Disclaimer

The Cyfrin team makes every effort to find as many vulnerabilities in the code as possible in the given time but holds no responsibility for the findings in this document. A security audit by the team does not endorse the underlying business or product. The audit was time-boxed and the review of the code was solely on the security aspects of the in-scope code being audited. Unless the scope explicitly notes otherwise, the review is limited to the application layer and does not extend to the correctness of API/SDK/execution environment implementations, compilers, standard and third-party libraries, underlying operating systems and hardware.

5 Audit Overview

Over the course of 5 days, the Cyfrin team conducted an audit on the Securitize Bridge CCTPv2 code provided by Securitize. The findings consist of 4 Medium & 4 Low severity issues with the remainder being informational and gas optimizations.

Summary

Project Name	Securitize Bridge CCTPv2
Repository	bc-securitize-bridge-sc
Commit	fbbbc11339b5...
Fix Commit	10c9d4a896e4...
Audit Timeline	Sep 22nd - Sep 26th, 2025
Methods	Manual Review

Issues Found

Severity	Found	Resolved	Acknowledged
Critical Risk	0	0	0
High Risk	0	0	0
Medium Risk	4	3	1
Low Risk	4	2	2
Informational	15	9	6
Gas Optimizations	9	4	5
Total	32	18	14

6 Audit Scope

The following contracts were in scope for this audit:

```
contracts/bridge/SecuritizeBridge.sol
contracts/bridge/USDCBridgeV2.sol
contracts/utils/BaseContract.sol
contracts/utils/BaseRBACContract.sol
contracts/utils/Proxies.sol
contracts/wormhole/WormholeCCTPUpgradeable.sol
```

7 Risk Classification

	Impact: High	**Impact: Medium**	**Impact: Low**
Likelihood: High	Critical	High	Medium
Likelihood: Medium	High	Medium	Low
Likelihood: Low	Medium	Low	Low

8 Protocol Summary

The Securitize Bridge protocol enables cross-chain interoperability for tokenized real-world assets (RWAs) and USDC stablecoin transfers via Circle's Cross-Chain Transfer Protocol (CCTP) v1 and v2. The system consists of two primary bridge contracts: `SecuritizeBridge` for bridging DS Tokens (digitally securitized tokens representing traditional securities) and `USDCBridge` (with its upgraded V2 variant) for USDC transfers using Wormhole integration with CCTP.

`SecuritizeBridge` facilitates the movement of DS Tokens between chains while maintaining regulatory compliance through integration with Securitize's registry service. When users bridge their tokens, the source chain burns the tokens and transmits both the transfer details and the investor's compliance attributes (KYC/AML data, accreditation status, and jurisdiction information) to the destination chain via Wormhole's message-passing infrastructure. Upon receipt, the destination chain mints equivalent tokens to the recipient while updating the local registry with the investor's compliance profile.

The USDC bridge components implement a dual-protocol architecture, combining Wormhole's cross-chain messaging with Circle's native CCTP for stablecoin transfers. The V2 implementation integrates with Circle's latest CCTP v2 features, including fast finality options and automated attestation handling. The bridge burns USDC on the source chain through Circle's `TokenMessenger` contract, while Wormhole relays the transfer metadata and CCTP attestation to enable minting on the destination chain. This design provides users with automated, single-transaction cross-chain transfers without requiring manual attestation retrieval or separate destination chain transactions.

9 Attestation

Cyfrin attests that it performed a security review of the Securitize Bridge CCTPv2 code provided by Securitize.

The repositories, commits, review period and findings with their final status are in the Summary and Issues Found tables in Section 5, and the in-scope files in Section 6. This attestation is limited to the documented scope, audited commits and mitigations specifically reviewed by Cyfrin.

Cyfrin publishes this document and its SHA-256 hash at https://github.com/Cyfrin/cyfrin-audit-reports. To check a copy on macOS or Linux, run the following in the folder that contains it; it prints `OK` when the copy matches. If the copy was renamed, set F to its file name. Before running it, check that the URL is Cyfrin's repository.

```
U=https://github.com/Cyfrin/cyfrin-audit-reports/raw/main/reports/sha256
N=2025-10-07-cyfrin-securitize-bridge-cctpv2-v2.0.pdf
F=$N
H=$(curl -fsSL $U/$N.sha256 | cut -d' ' -f1)
echo "$H *$F" | shasum -a 256 -c
```

Cyfrin's full audit report with all findings provided to Securitize has the SHA-256 hash and file name below. To check a copy of it, first check this document as above, then run the following in the folder that contains the full report; it prints `OK` when the copy matches. If the copy was renamed, set F to its file name.

```
H=3d469d671f2a2db85753ca9286caf7f14acb8fa0da5bd3ef30f961ef83cc70c3
F=2025-10-07-cyfrin-securitize-bridge-cctpv2-v2.0-full.pdf
echo "$H *$F" | shasum -a 256 -c
```

On Linux, `sha256sum -c` can be used in place of `shasum -a 256 -c`. On Windows, run `Get-FileHash <file> -Algorithm SHA256` in PowerShell and compare the result with the hash.
