1 About Cyfrin

Cyfrin is a Web3 security company dedicated to bringing industry-leading protection and education to our partners and their projects. Our goal is to create a safe, reliable, and transparent environment for everyone in Web3 and DeFi. Learn more about us at cyfrin.io.

2 About This Document

This document is a public summary of the security audit Cyfrin performed for Securitize on Securitize Solana Bridge. It records the repositories and commits reviewed, the timeline, auditors, in-scope files, and the number and final status of findings by severity. It closes with Cyfrin's attestation of the review's scope and final remediation status.

It is deliberately abbreviated: the technical detail of individual findings is not reproduced here. The complete audit report, version 2.1 dated April 30, 2026, was delivered to Securitize, who retain it as the full record of the engagement. This summary was issued on October 29, 2026.

3 Disclaimer

The Cyfrin team makes every effort to find as many vulnerabilities in the code as possible in the given time but holds no responsibility for the findings in this document. A security audit by the team does not endorse the underlying business or product. The audit was time-boxed and the review of the code was solely on the security aspects of the in-scope code being audited. Unless the scope explicitly notes otherwise, the review is limited to the application layer and does not extend to the correctness of API/SDK/execution environment implementations, compilers, standard and third-party libraries, underlying operating systems and hardware.

5 Audit Overview

Over the course of 8 days, the Cyfrin team conducted an audit on the Securitize Solana Bridge code provided by Securitize. The findings consist of 2 High, 7 Medium & 13 Low severity issues with the remainder being informational and gas optimizations.

Summary

Project Name	Securitize Solana Bridge
Repository	bc-solana-bridge-sc
Commit	e20a94507646...
Fix Commit	9dc11664d3e6...
Audit Timeline	Mar 31st - Apr 9th, 2026
Methods	Manual Review

Issues Found

Severity	Found	Resolved	Acknowledged
Critical Risk	0	0	0
High Risk	2	1	1
Medium Risk	7	3	4
Low Risk	13	11	2
Informational	17	13	4
Gas Optimizations	5	4	1
Total	44	32	12

6 Audit Scope

The audit scope was limited to:

```
programs/securitize_bridge/src/instructions/admin/initialize.rs
programs/securitize_bridge/src/instructions/admin/remove_bridge_address.rs
programs/securitize_bridge/src/instructions/admin/remove_emitter_address.rs
programs/securitize_bridge/src/instructions/admin/set_bridge_address.rs

7 Risk Classification

	Impact: High	**Impact: Medium**	**Impact: Low**
Likelihood: High	Critical	High	Medium
Likelihood: Medium	High	Medium	Low
Likelihood: Low	Medium	Low	Low

8 Protocol Summary

The Securitize Solana Bridge is a cross-chain bridging system for tokenized securities (DS tokens) and USDC, implemented as two independent Anchor programs on Solana. The DS token bridge uses Wormhole for message transport and integrates with Securitize's RWA RBAC stack for compliant token issuance and revocation, while the USDC bridge uses Circle's CCTP V2 for native cross-chain USDC burns and mints. Both programs use the Wormhole Executor for automated relay of cross-chain messages.

The core mechanism operates as a burn-and-mint bridge. On the outbound path, DS tokens are burned via the RBAC revocation flow, then a Wormhole message carrying an ABI-encoded payload is published for relay to the destination chain. On the inbound path, a posted Wormhole VAA is processed and tokens are minted to the recipient through the RBAC issuance flow. The USDC bridge follows a similar pattern using Circle CCTP V2's `deposit_for_burn` mechanism, with executor fee reimbursement handled through the config PDA's SOL balance.

The architecture centers on two programs:

- `securitize_bridge` handles DS token bridging and integrates with the Securitize identity and compliance stack, including the Identity Metadata Registry for investor KYC, the Policy Engine for lock periods and country-specific restrictions, and the Asset Controller for mint authority management. It also includes a Wormhole Executor resolver (fallback handler) that derives the accounts required for automated inbound execution from raw VAA data.
- `securitize_usdc_bridge` handles USDC bridging through Circle CCTP V2.

9 Attestation

Cyfrin attests that it performed a security review of the Securitize Solana Bridge code provided by Securitize.

The repositories, commits, review period and findings with their final status are in the Summary and Issues Found tables in Section 5, and the in-scope files in Section 6. This attestation is limited to the documented scope, audited commits and mitigations specifically reviewed by Cyfrin.

Cyfrin publishes this document and its SHA-256 hash at https://github.com/Cyfrin/cyfrin-audit-reports. To check a copy on macOS or Linux, run the following in the folder that contains it; it prints `OK` when the copy matches. If the copy was renamed, set F to its file name. Before running it, check that the URL is Cyfrin's repository.

```
U=https://github.com/Cyfrin/cyfrin-audit-reports/raw/main/reports/sha256
N=2026-04-30-cyfrin-securitize-solana-bridge-v2.1.pdf
F=$N
H=$(curl -fsSL $U/$N.sha256 | cut -d' ' -f1)
echo "$H *$F" | shasum -a 256 -c
```

Cyfrin's full audit report with all findings provided to Securitize has the SHA-256 hash and file name below. To check a copy of it, first check this document as above, then run the following in the folder that contains the full report; it prints `OK` when the copy matches. If the copy was renamed, set F to its file name.

```
H=b86611682d30ff914c314a46ff27c64f1947909ebd39ba2ab577b56e5083b53c
F=2026-04-30-cyfrin-securitize-solana-bridge-v2.1-full.pdf
echo "$H *$F" | shasum -a 256 -c
```

On Linux, `sha256sum -c` can be used in place of `shasum -a 256 -c`. On Windows, run `Get-FileHash <file> -Algorithm SHA256` in PowerShell and compare the result with the hash.
